

Appendix with figures for final report – Klapwijk

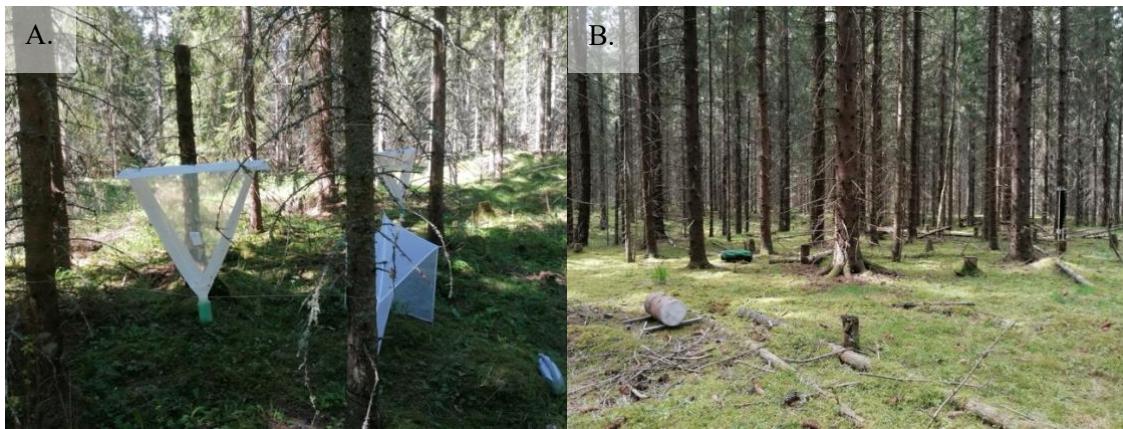

Figure 1 A) Placing of the malaise trap and the window traps in the stands. B) Placing of the stem sections with the funneltrap

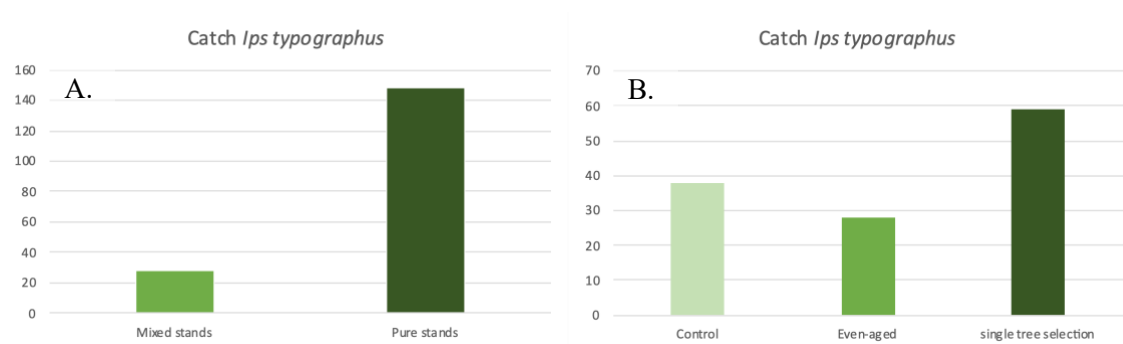

Figure 2 A) The catch of *Ips typographus* in window traps for the mixed forest data collection and B) the continuous cover forest data collection. The bars represent the total catch of individuals over the trapping season.

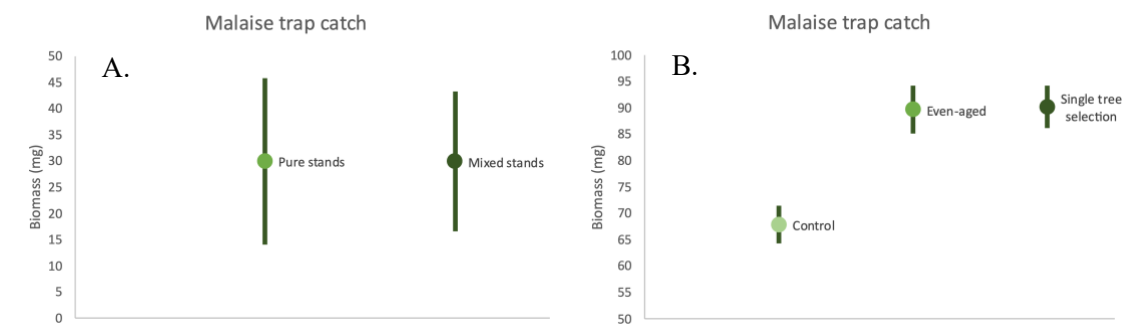

Figure 3 A) The average biomass (mg) for malaise trap catches in mixed and pure stands plus minus the standard deviation (errorbars). B) Average biomass (mg) for malaise trap catches in control, even-aged and single tree selection stands.

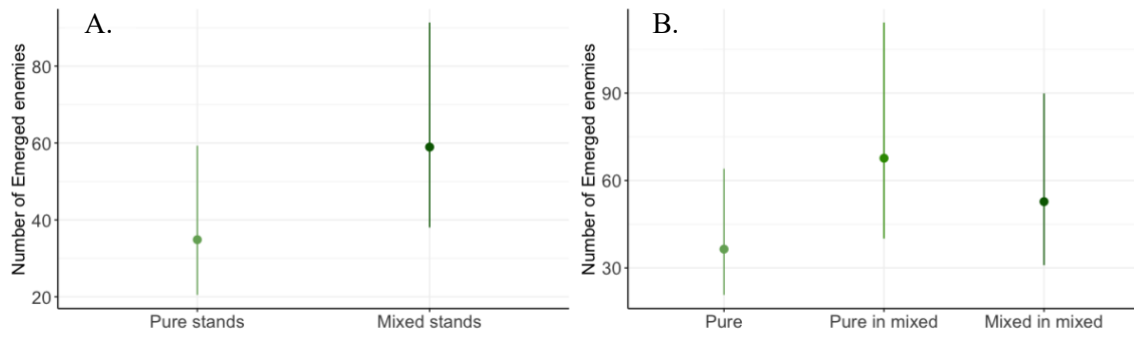

Figure 3 A) Difference between the average emerged enemies in pure and mixed stands B) Difference in average enemy emergence between pure stands and the spruce dominated area in the mixed stands (Pure in mixed) and the deciduous tree dominated part of the mixed stands. (errorbars =  $\pm 95\%$  confidence interval)
